DICY Overview

Commonly known as **DICY**andiamide (**DICY**), the white crystalline compound is the dimer for cyanamide or for cyanoguanidine. The primary use of the chemical is in the production of melamine, but it is also as a curing agent for epoxy resins.

DICY crystals melt at 45° C, and are soluble in water and alcohol. Other uses for the compound are in the manufacture of fertilizers, explosives, oil well drilling muds, pharmaceuticals, and dyestuffs.

The Chemical Company (TCC) delivers **DICY** nationwide with one week lead time in 25kg bags and 1,000kg supersacks.
